

Basic Fetch API – Student Task

Objective

Practice using the Fetch API, Promises, `response.json()`, and DOM manipulation by fetching user data from an API and displaying it on a webpage.

API

`https://jsonplaceholder.typicode.com/users`

Task

Create an HTML page that fetches user data from the above API and displays it when the user clicks a button.

Requirements

- 1 Create a button with the text: `<b>Load Users</b>`.
- 2 Create an empty `<code><div></code>` to display the users.
- 3 When the button is clicked, use `<code>fetch()</code>` to call the API.
- 4 Convert the response using `<code>response.json()</code>`.
- 5 Display every user's Name, Email, Phone, and City.
- 6 Display each user inside a separate card.
- 7 If an error occurs, display: `<b>Something went wrong. Please try again.</b>`.

Expected Output

[Load Users]

```
-----
Name: Leanne Graham
Email: Sincere@april.biz
Phone: 1-770-736-8031
City: Gwenborough
-----

-----
Name: Ervin Howell
Email: Shanna@melissa.tv
Phone: 010-692-6593
City: Wisokyburgh
-----
```

Concepts to Practice

fetch() → Promise → response.json() → data → forEach() → DOM manipulation
